Cron Jobs

Easily monitor and manage your cron jobs.

Disabling this feature will prevent all cron jobs from being executed. New cron jobs will still be created, updated, and deleted on each production deployment, but they will not run until the feature is reactivated.

Learn more about Cron Jobs

Get Started with Cron Jobs on Vercel

Next.js (App Router) | Next.js (Pages Router) | Vercel CLI | SvelteKit | Remix | Nuxt | SolidStart

1 Add a Serverless Function to your project

app/api/cron/route.js

```
import { NextResponse } from 'next/server';

export async function GET() {
  return NextResponse.json({ ok: true });
}
```

2 Add a cron job to your vercel.json

vercel.json

```
{
  "crons": [{
    "path": "/api/cron",
    "schedule": "0 10 * * *"
  }]
}
```

3 Add a secret to your project

Prevent unauthorized access by adding the `CRON_SECRET` environment variable to your project and check incoming requests. Vercel will add it to all cron job invocations as part of the `Authorization` header, allowing you to specify any value you'd like for authorization.

```
const authHeader = req.headers.get('Authorization');
const cronSecret = process.env.CRON_SECRET;

if (!cronSecret || authHeader !== `Bearer ${cronSecret}`) {
  return res.status(401).end('Unauthorized');
}
```
