Colors

Learn how to work with our color system. Right click to copy raw values.

Scales

There are 10 color scales in the system. P3 colors are used on supported browsers and displays.

Choose gray or gray-alpha

- **Gray** for text, icons, fills, borders, and dividers by default.
- **Gray-alpha** only when the background should show through, such as in shadows or overlays.

Draw each border once

✓ Do Keep the divider inside the border.

✕ Avoid Overlapping alpha borders make intersections stand out.

Keep material shadows translucent

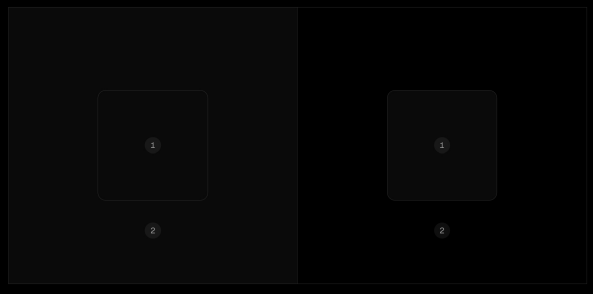

✓ Do Transparent shadows blend with the background.

✕ Avoid Opaque shadows leave a gray halo.

Backgrounds

There are two background colors for pages and UI components. In most instances, you should use Background 1—especially when color is being placed on top of the background. Background 2 should be used sparingly when a subtle background differentiation is needed.

Background 1	Default element background
Background 2	Secondary background

Colors 1–3: Component Backgrounds

These three colors are designed for UI component backgrounds.

Color 1	Default background
Color 2	Hover background
Color 3	Active background

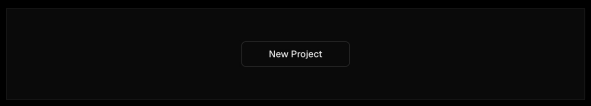

If your UI component's default background is Background 1, you can used Color 1 as your hover background and Color 2 as your active background. On smaller UI elements like badges, you can use Color 2 or Color 3 as the background.

Colors 4-6: Borders

These three colors define default, hover, and active border strength. Use solid gray by default. Use the matching gray-alpha step only when the edge needs to blend with its surface.

Color 4	Default border
Color 5	Hover border
Color 6	Active border

Colors 7-8: High Contrast Backgrounds

These two colors are designed for high contrast UI component backgrounds.

Color 7	High contrast background
Color 8	Hover high contrast background

Colors 9-10: Text and Icons

These two colors are designed for accessible text and icons.

Color 9	Secondary text and icons
Color 10	Primary text and icons
