Materials

Presets for radii, fills, strokes, and shadows.

Surface

On the page.

Aa Example	Class name	Usage
	`material-base`	Everyday use. Radius 6px.
	`material-small`	Slightly raised. Radius 6px.
	`material-medium`	Further raised. Radius 12px.
	`material-large`	Further raised. Radius 12px.

Floating

Above the page.

Aa Example	Class name	Usage
	`material-tooltip`	Lightest shadow. Corner 6px. Tooltips will be the only floating element with a triangular stem.
	`material-menu`	Lift from page. Radius 12px.
	`material-modal`	Further lift. Radius 12px.
	`material-fullscreen`	Biggest lift. Radius 16px.

Best Practices

When to use

- Use Material instead of hand-rolling radii, fills, strokes, and shadows on a surface; the type encodes the elevation role.
- Pick the type from where the element sits in the layered hierarchy: `base` for resting cards, `small`–`large` for raised content, `tooltip` and `menu` for floating popovers, `modal` for dialogs, `fullscreen` for takeovers.
- Don't stack two Materials on the same element; if a child needs more elevation, lift it into its own Material with a higher type.

Behavior

- Align the elevation choice with the element's `z-index` band so a `tooltip`-typed surface doesn't sit visually below a `base` card.
- Favor the lowest elevation that still reads as elevated against its background; over-elevating is a common source of visual noise.
- Let the type drive chrome and use layout spacing for layout instead of overriding shadows on the same element.

Accessibility

- Material is decorative chrome; semantics live on the role-bearing wrapper (`role="dialog"` on a modal, `role="tooltip"` on a tooltip, etc.).
- Don't rely on shadow alone to communicate elevation; pair with the matching focus-visible ring on focusable children inside.
- Test materials in both themes: shadow contrast on dark backgrounds is weaker than on light, so confirm separation still reads.
