Sheet

Display content in a side panel that slides in from the edge of the screen.

Default

In combination with styles overrides most commonly used in front apps.

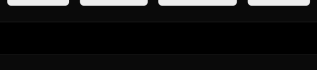

Hide code

```tsx
import {
  Button,
  Sheet,
  SheetClose,
  SheetContent,
  SheetDescription,
  SheetFooter,
  SheetHeader,
  SheetTitle,
  SheetTrigger,
} from '@vercel/geistcn/components';
import type { JSX } from 'react';

export function Component(): JSX.Element {
  return (
    <Sheet modal>
      <SheetTrigger asChild>
        <Button>Open Sheet</Button>
      </SheetTrigger>
      <SheetContent
        noOverlay={false}
        className="m-3 h-[calc(100%-1.5rem)] w-[calc(100%-1.5rem)] rounded-2xl bg-background-100 p-0 lg:
      >
        <SheetHeader className="p-6 text-left">
          <SheetTitle>Sheet Title</SheetTitle>
          <p className="text-copy-14 text-gray-900">
            Lorem ipsum dolor sit amet, consectetur adipiscing elit.
          </p>
        </SheetHeader>
        <SheetDescription className="px-6 py-4 text-copy-14">
          Eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad
          minim veniam, quis nostrud exercitation ullamco laboris nisi ut
          aliquip ex ea commodo consequat.
        </SheetDescription>
        <SheetFooter className="p-6 gap-2 flex-row justify-end mt-auto">
          <SheetClose asChild>
            <Button variant="secondary">Close</Button>
          </SheetClose>
          <Button>Next</Button>
        </SheetFooter>
      </SheetContent>
    </Sheet>
  );
}
```

With Side

Use the `side` prop to control which edge the sheet slides in from.

Hide code

```tsx
import {
  Button,
  Sheet,
  SheetContent,
  SheetHeader,
  SheetTitle,
  SheetTrigger,
} from '@vercel/geistcn/components';
import type { JSX } from 'react';

const sides = ['top', 'right', 'bottom', 'left'] as const;

export function Component(): JSX.Element {
  return (
    <div className="flex items-center justify-center gap-4">
      {sides.map((side) => (
        <Sheet key={side} modal>
          <SheetTrigger asChild>
            <Button>Open {side}</Button>
          </SheetTrigger>
          <SheetContent side={side}>
            <SheetHeader>
              <SheetTitle>Sheet from {side}</SheetTitle>
              <p className="text-copy-14 text-gray-900">
                This sheet slides in from the {side}.
              </p>
            </SheetHeader>
          </SheetContent>
        </Sheet>
      ))}
    </div>
  );
}
```

Best Practices

When to use

- Use Sheet for persistent associated context like deployment details, log row inspection, or a member profile, where the underlying page stays useful.
- For a blocking decision, use **Modal**. For a mobile-only bottom sheet, use **Drawer**.
- Don't use Sheet to confirm destructive actions. The default `modal=false` keeps the page interactive, which weakens severity for a delete or revoke.

Behavior

- Sheet defaults to `modal=false` so toasts and other high-z elements stay reachable. Keep that default unless the sheet owns the screen.
- Pick `side` from the trigger location: a row inspector slides from `right`, a global filter from `left`. Don't change sides mid-session.

- Outside-click does not auto-close, so always render an explicit close affordance and honor Escape.

Content

- Title is Title Case and names the entity (`Deployment Details`, `Member Profile`), not the page action.
- Body is read-mostly: sentence case prose with Title Case sub-headings. Action buttons are optional; when present, follow `Verb + Noun`.
- Don't duplicate the page header inside the sheet; the sheet is the detail layer.

Accessibility

- Trap focus inside the sheet while it's open and return focus to the trigger row on close so keyboard users keep their place in the list.
- Provide a visible close button labeled `Close` (or an icon button with `aria-label="Close"`) since clicking outside doesn't dismiss.
- Announce the sheet with `aria-labelledby` pointing at the title; pair it with `aria-describedby` only when the body is short and load-bearing.
