Choosing an architecture

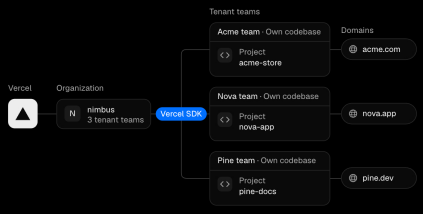

Most multi-tenant platforms on Vercel follow one of two patterns. Pick the one that matches how isolated each customer needs to be:

Build single-codebase platforms. One codebase, one deployment serves every tenant.

Tenants	Each tenant shares the same functionality, with its own content, branding, data, and configuration. Route customers through custom domains, wildcard subdomains, or URL paths to the same application.
Complexity	Lower
Best for	Content and branding differ, but functionality is the same: documentation sites, website builders, and SaaS dashboards.
Used by	Mintlify

Single-codebase docs

Build multi-codebase platforms. One team per tenant, multiple codebases.

Tenants	Each tenant can run custom code with independent configuration and infrastructure. Manage tenant teams and codebases through the REST API or the Vercel SDK.
Complexity	Higher
Best for	Each tenant needs custom code or isolated infrastructure: AI coding platforms and user-generated apps.
Used by	Grok Build

Multi-codebase docs

What you can build

Teams run many kinds of platforms on Vercel:

AI app builders

Build AI app builders and AI coding agent platforms where agents generate code and each app gets an isolated project and deployment, such as General Intelligence.

AI agent builders

Give agents Sandbox and access to multiple models through AI Gateway out of the box.

Documentation platforms

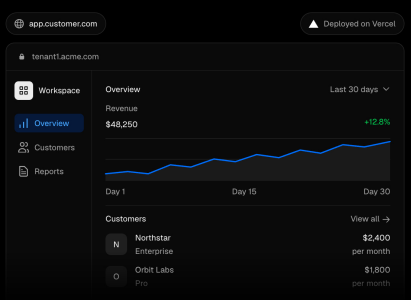

Publish documentation for every customer from a shared platform with their own content, branding, and domains.

Content platforms

Give every publication a home with custom domains and a shared publishing experience.

B2B SaaS platforms

Build tenant-specific dashboards and applications on a platform that scales with your customers.

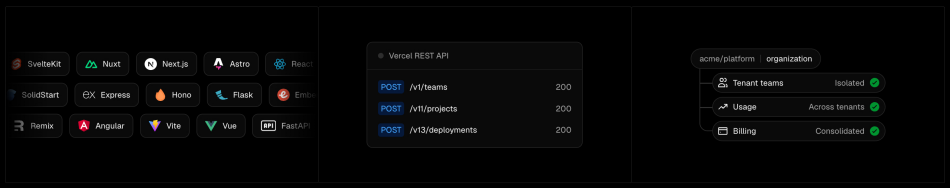

Used by _zapier

A typical setup gives you a root domain for your platform (acme.com), subdomains for tenants (tenant1.acme.com), and fully custom domains for customers who want them (tenantcustomdomain.com).

What you get

The fastest path to launch with:

35+ frameworks

Build with your choice of frontend and backend frameworks.

Programmatic management

Create and manage your platform through the REST API or the Vercel SDK.

Global controls and spend management

Manage global controls and spend across all your tenants.

Automatic SSL

Vercel issues and renews SSL certificates after domain verification.

Your customers' domains

Add custom domains and *.yourdomain.com subdomains, subject to plan limits.

White-label Vercel products

Give your customers white-label access to Vercel products, including AI Gateway and Sandbox.

Tenant-specific previews

Enable tenant-specific previews with multi-tenant preview URLs.

Prebuilt platform elements

Add ready-to-use UI components for common platform flows and server-side functions that wrap common Vercel API calls, without writing the integration yourself.

Explore the docs

Choose an architecture, start from a template, or add platform elements to your app.

Single-codebase platforms

Serve every tenant from one codebase and deployment, with custom domains and subdomains.

Multi-codebase platforms

Run multiple codebases with one team per tenant for custom code and isolated infrastructure.

Examples

Start from multi-codebase AI app builders or single-codebase platform templates.

Platform elements

Drop in prebuilt actions and UI blocks for domains and deployments.

Starter template

Deploy a single-codebase Next.js platform with subdomain routing and tenant storage.
