Introducing Vercel Passport

Secure every internal agent, app, and deployment with your existing identity provider.

Open

Forge-proof verification

After a user clears the gate, Passport gives the agent a signed JWT in the `x-vercel-oidc-passport-token` header. Read from your data source like Snowflake or Salesforce and your permissions apply to the real person, not a shared service account.

Authenticate once, control everything

Every deployment is gated by your identity provider. Authenticate with Okta, Auth0, or any OAuth 2.0 / OpenID Connect provider.

Unlimited users. Put Passport in front of every internal tool, agent, and app, and let the whole company in at no additional cost.

Never write a line of auth. Define access for your whole organization in one place while all agents and applications inherit.

Use Passport with your framework

Read visitor identity and control access with a guide for your framework. Explore local development, personalization, and authorization.

View all enterprise guides

Next.js

Read visitor identity in App Router pages, Route Handlers, and Server Actions.

Nuxt

Personalize pages and protect server routes with verified visitor identity.

Backends

Read and verify visitor identity in Express, Hono, Nitro, and FastAPI backends.

Frequently asked questions

01 What is Vercel Passport?

Vercel Passport gates every app and agent you deploy behind your own identity provider. Each deployment is private by default, and once a user signs in, the app receives a signed identity it can trust, so your IdP controls what that person can reach downstream.

02 What problem does Vercel Passport solve?

03 Which identity providers can I use?

04 How does Vercel Passport work?

05 How do I read a signed-in visitor's identity?

06 Does Vercel Passport work with Vercel Connect?

07 Does Vercel Passport work for agents too?

08 What does Passport cost?
